

Educational Volunteer Coordination Platform

Authors: Jose Luis Leudo Mosquera, David Santiago Rojas Hernández, Adrián Mauricio Hernández Ortiz, Johan Sebastian Candia Marín
University: Universidad Distrital Francisco José de Caldas
Advisor: Professor Carlos Andrés Sierra, M.Sc.

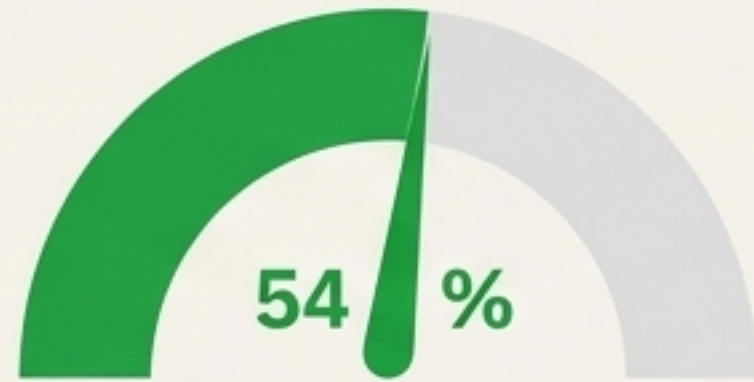

The Social Context: The Intersection of Need and Talent

Transforming manual assignment into a traceable digital ecosystem.

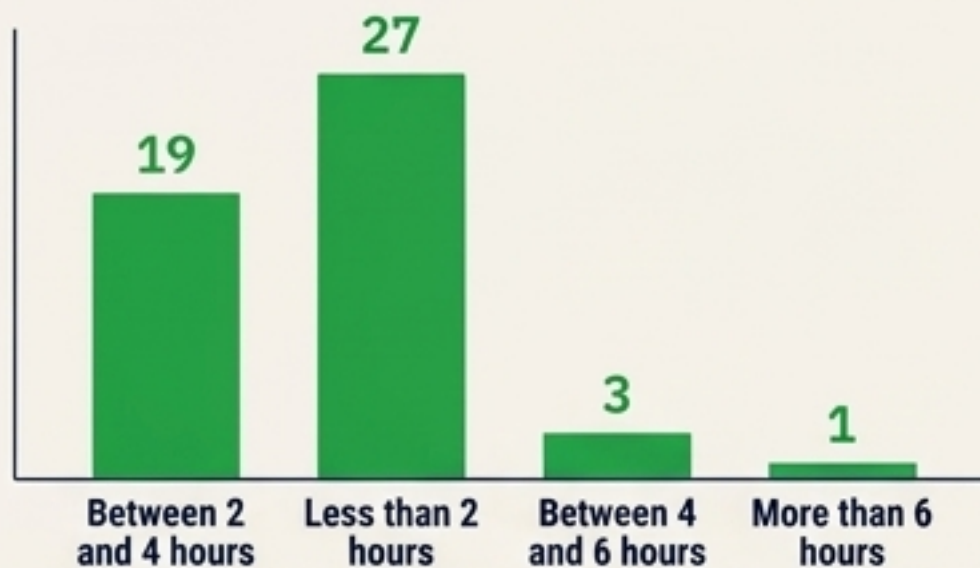

Listening to the User: Baseline Survey Findings (N=50)

Empirical data directly dictates the architectural constraints of the system.

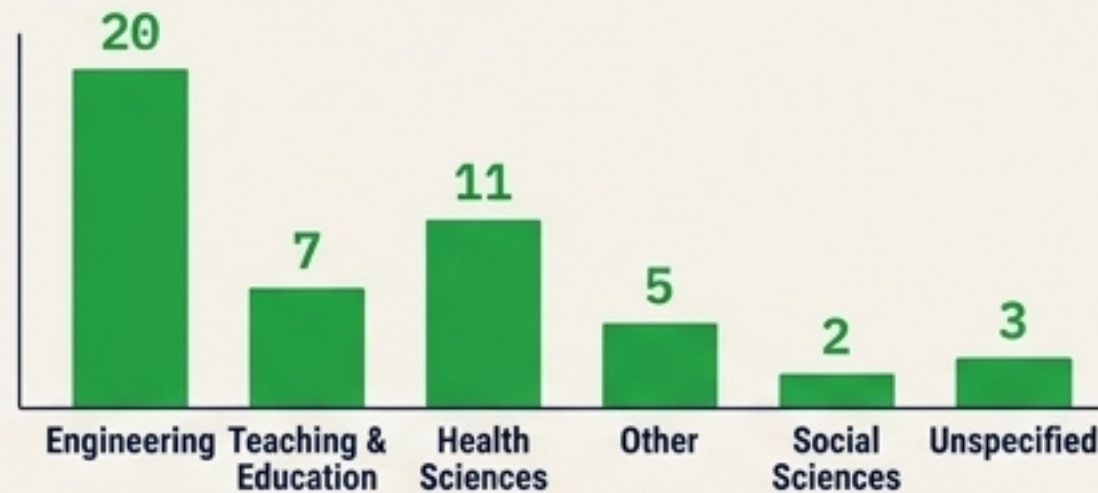

54% possess < 2 hours/week

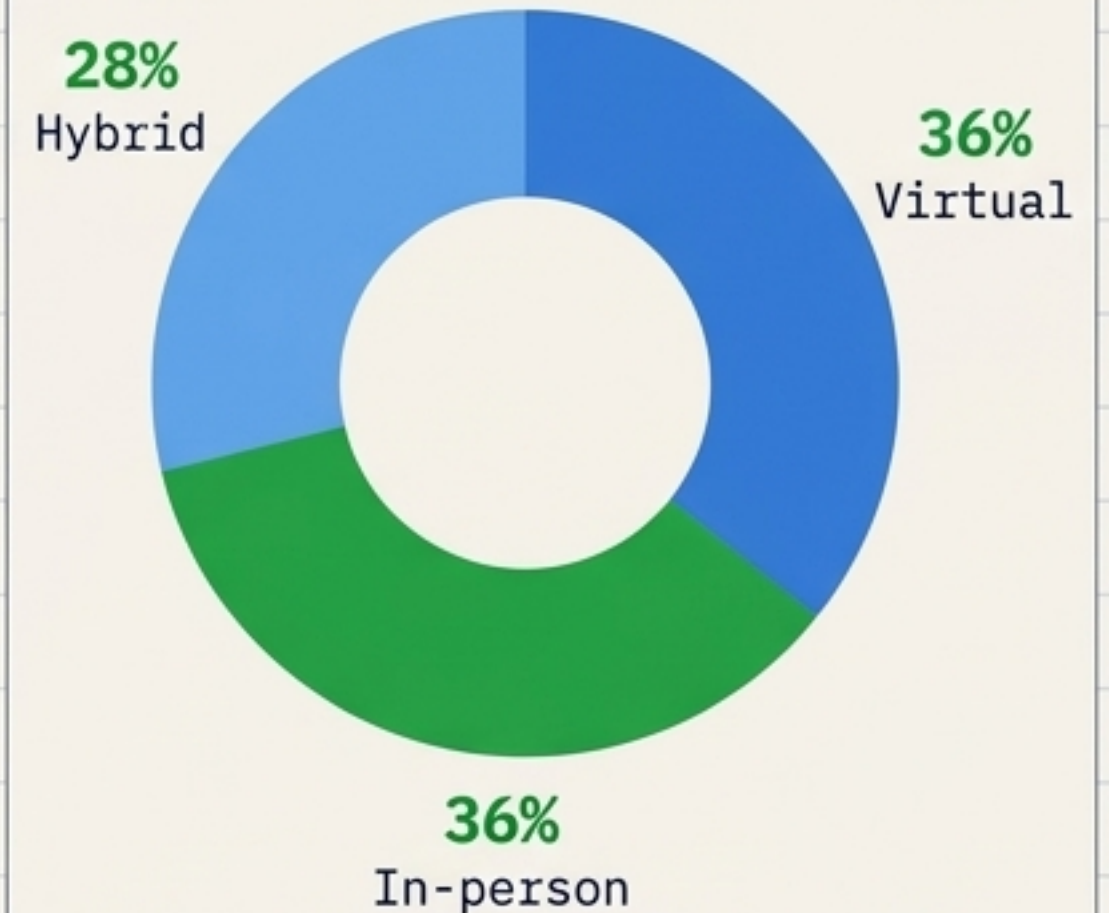

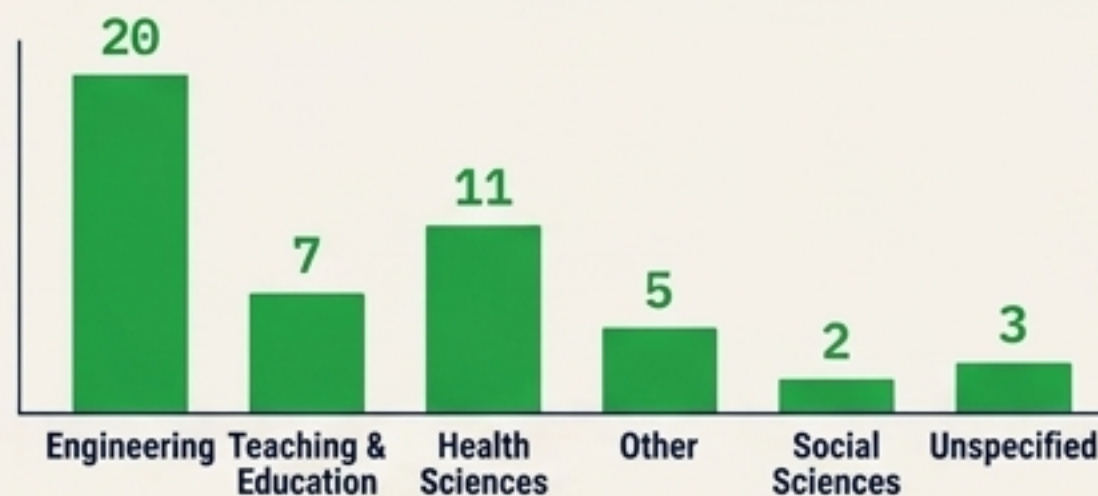

Constraint: Requires a hyper-efficient micro-scheduling engine.

40% Engineering/Math profiles

Constraint: High supply for technological and numerical projects.

Constraint: Simultaneous management of connectivity and geolocation metrics.

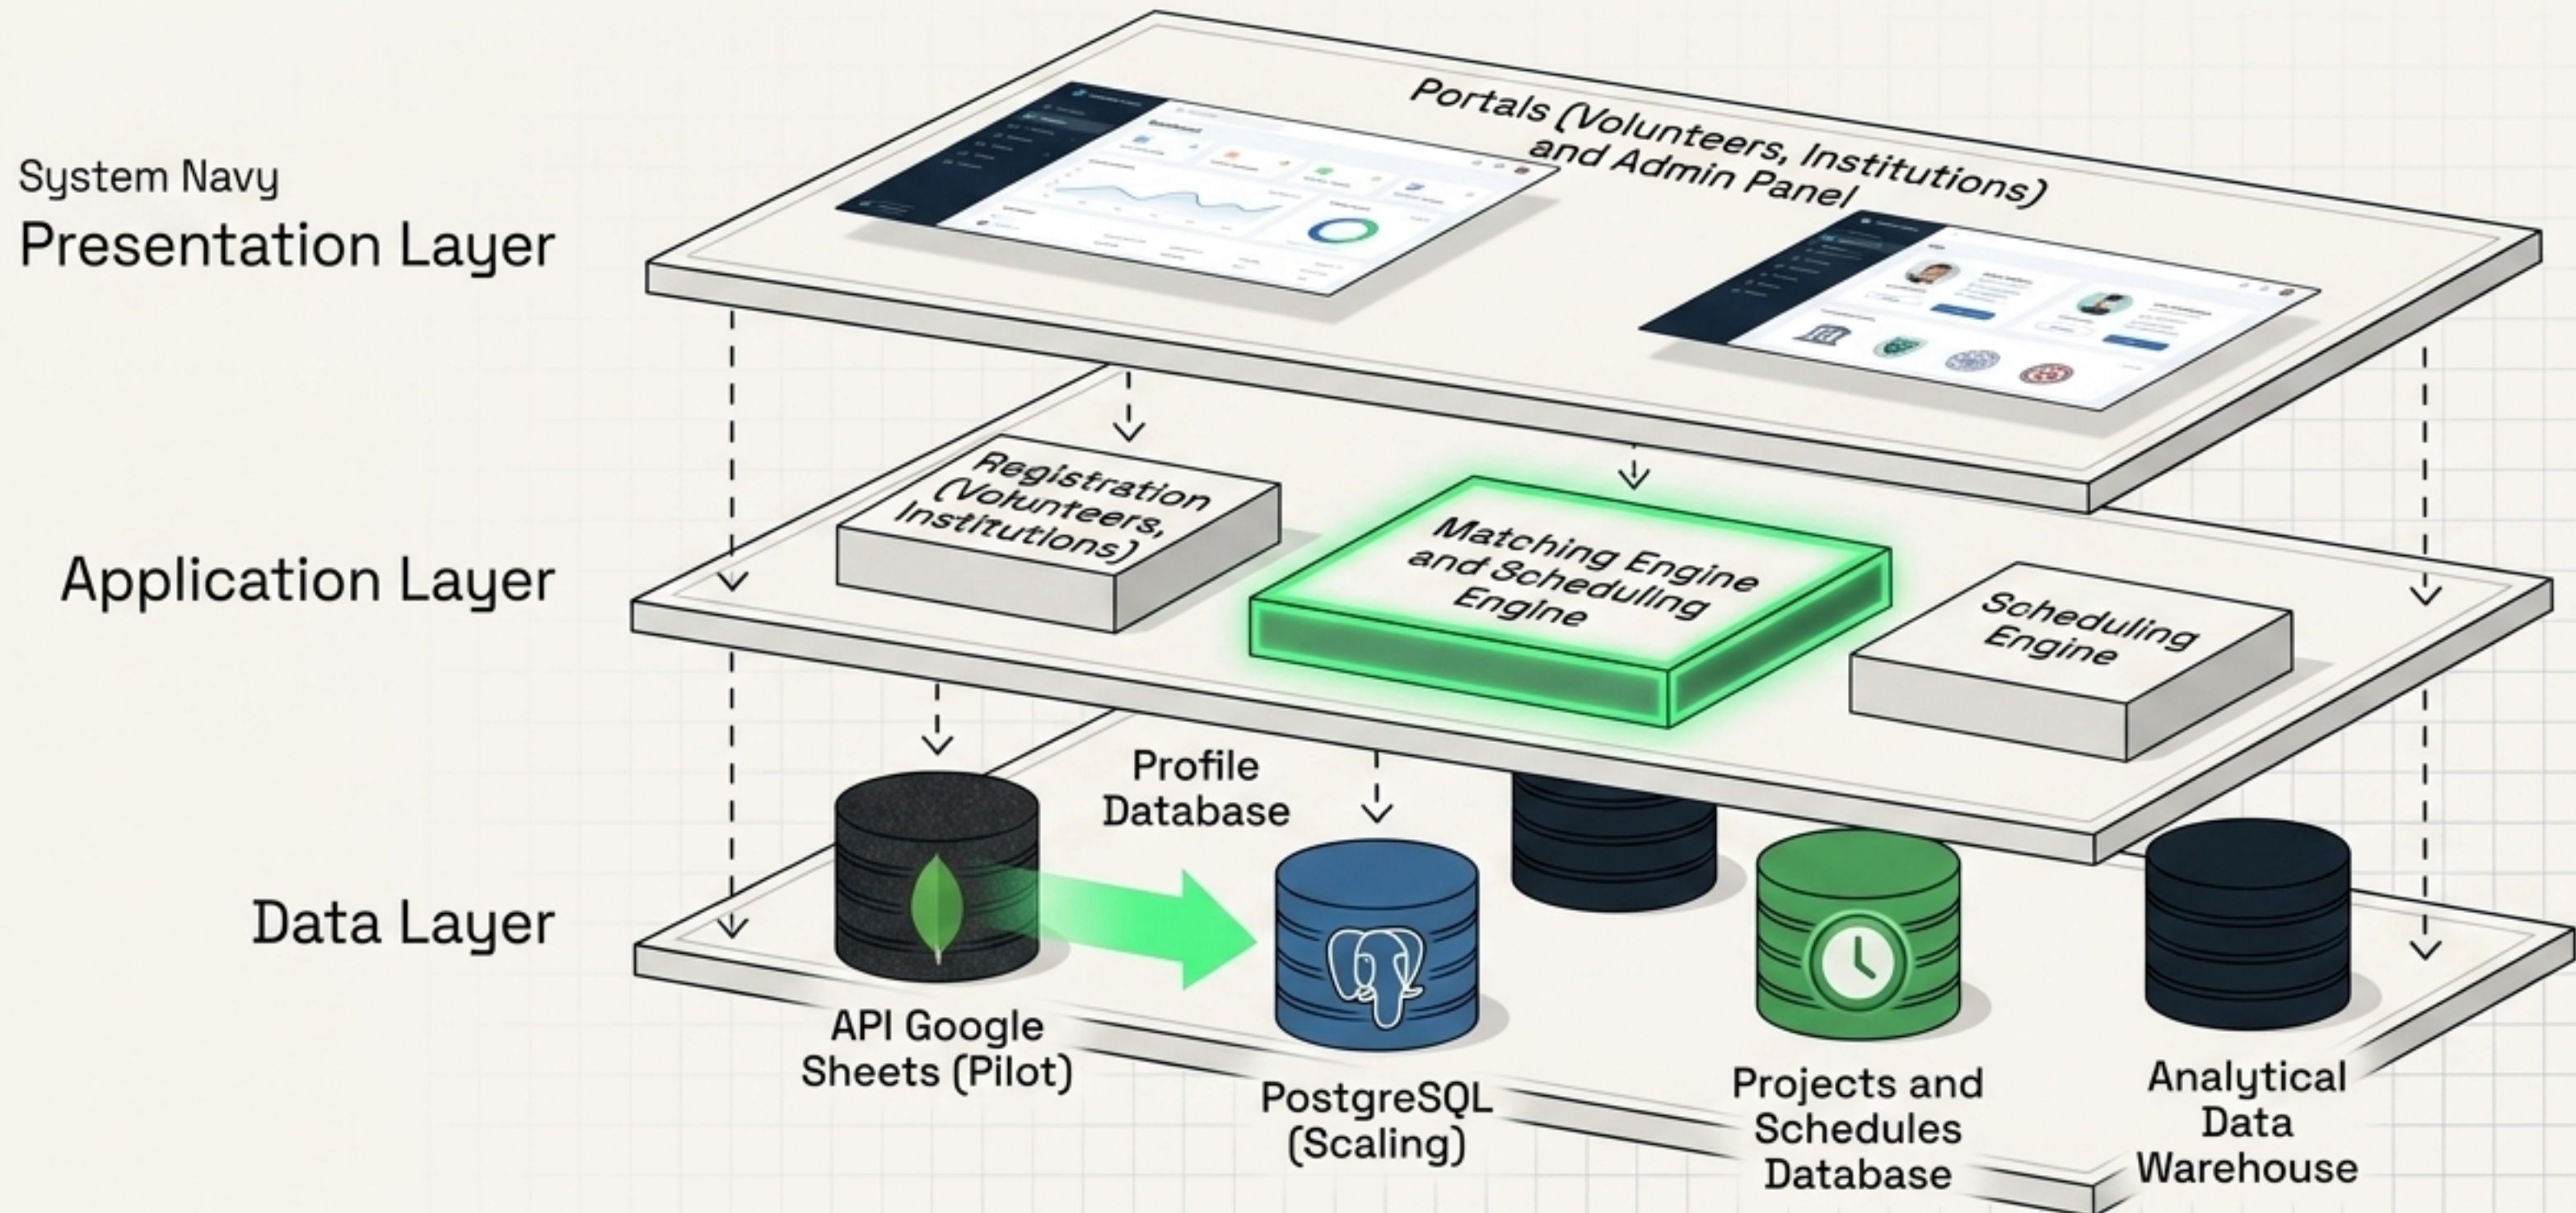

System Foundations: Critical Requirements (Workshop 2)

Defining success parameters for a scalable ecosystem.

Functional Requirements	Non-Functional Requirements
 Registration: Granular capture of profiles, competencies, and availability.	 Latency < 60s For the assignment engine.
 Matching: Mathematical algorithm for weighted compatibility.	 Availability > 99% Guaranteed monthly system uptime.
 Monitoring: Traceability of sessions and academic impact.	 80+ Users Guaranteed concurrent capacity.

Robust 3-Layer Architecture

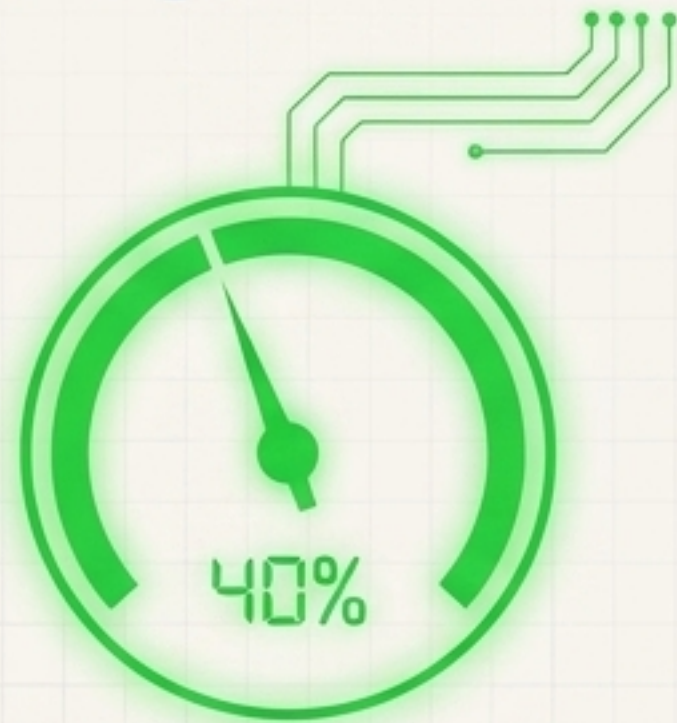

Modular design based on microservices and high fault tolerance.

The Core Engine: Weighted Compatibility Algorithm

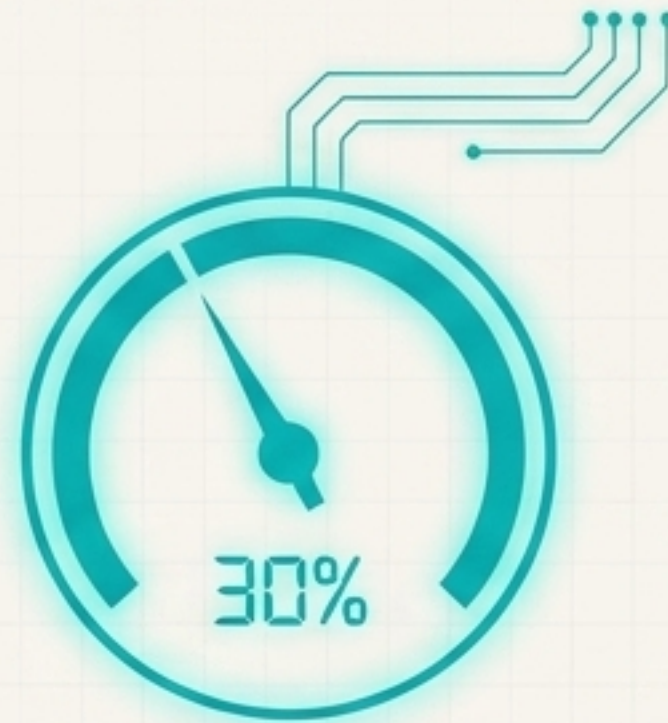

Mathematical quantification of human interaction.

$$C(v,p) = 0.40(Sk) + 0.30(Sc) + 0.15(SI) + 0.15(Se)$$

Academic Skill (Sk)

Dominant factor driven by tutoring needs.

Availability (Sc)

Mitigates the constraint of low volunteer time.

Proximity/Connectivity (SI)

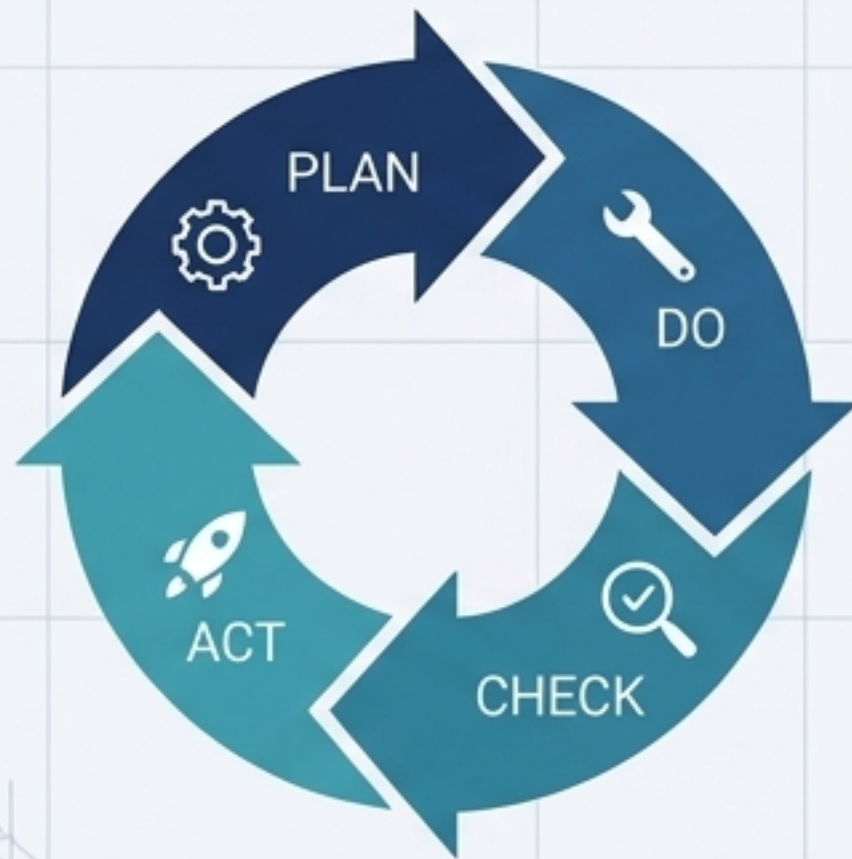

Pedagogical Experience (Se)

International Standards Framework (Workshop 3)

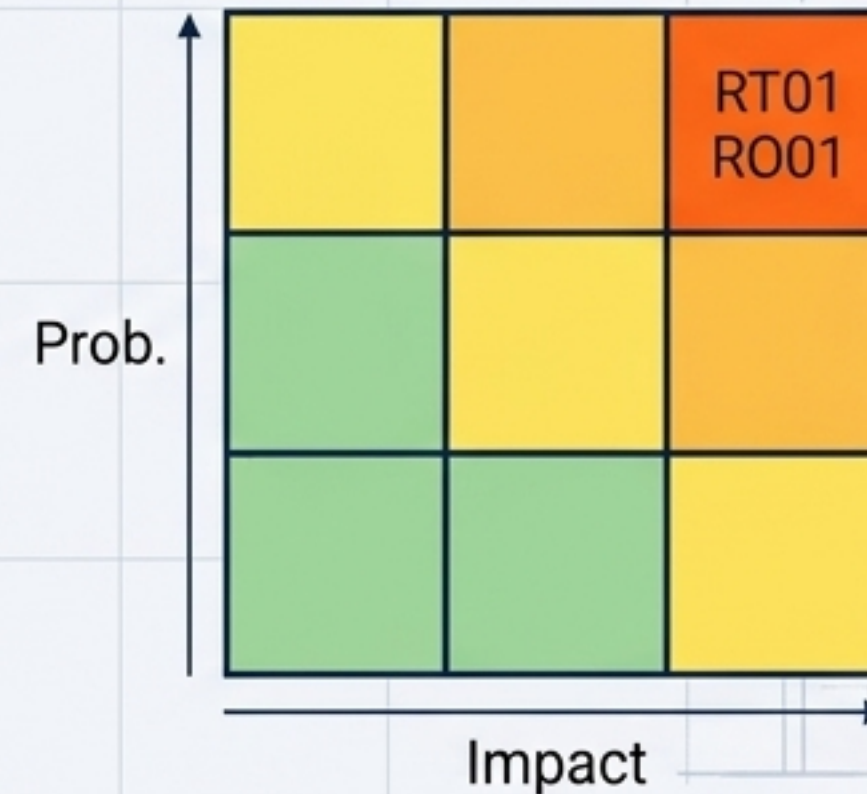

Quality assurance and proactive threat mitigation.

ISO 9001:2015 - Quality Management

PDCA cycle for continuous improvement and usability testing.

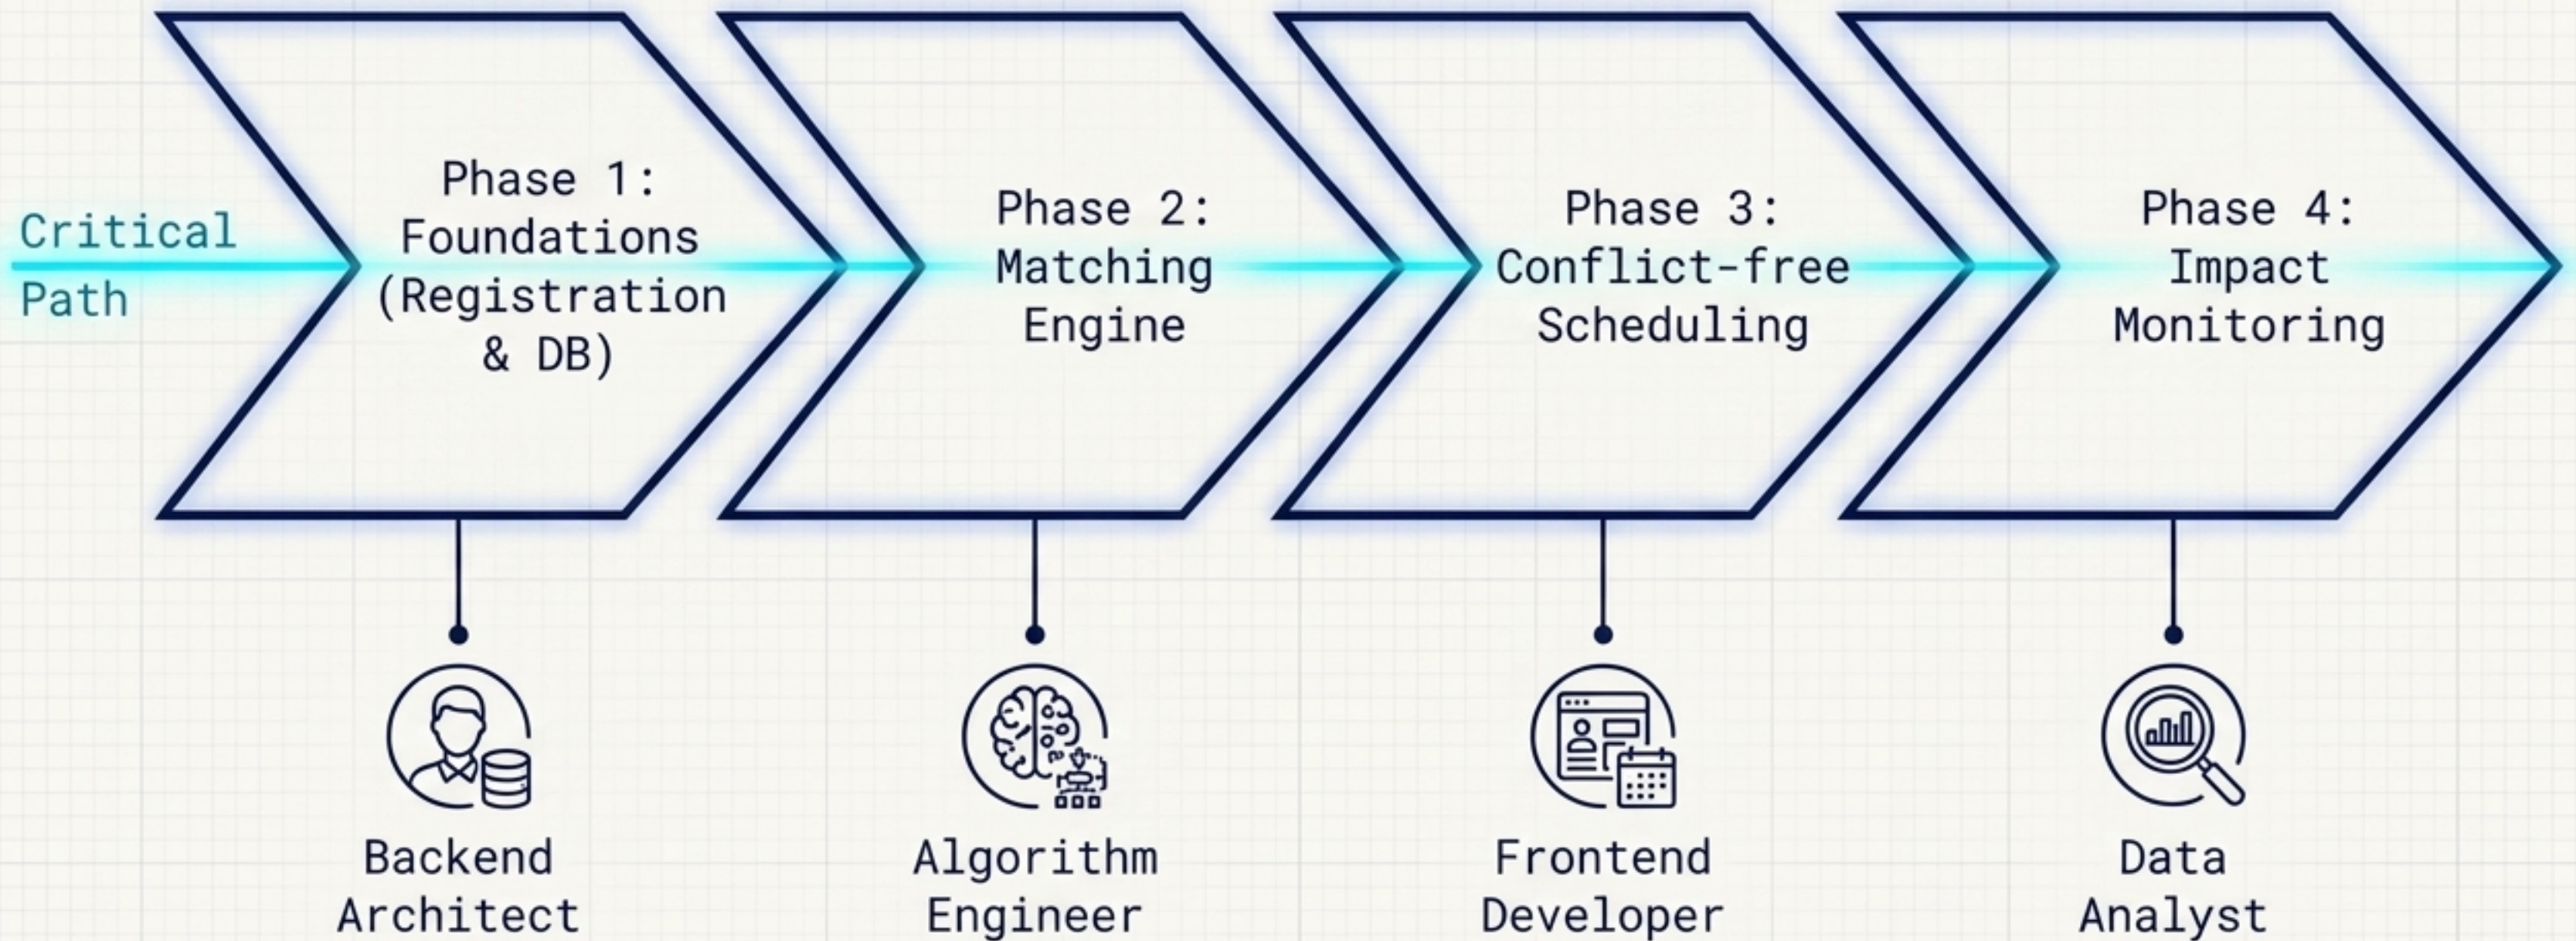

ISO 31000 - Risk Management

Heat matrix highlighting RT01 (Low data quality) and R001 (Volunteer shortage) as critical.

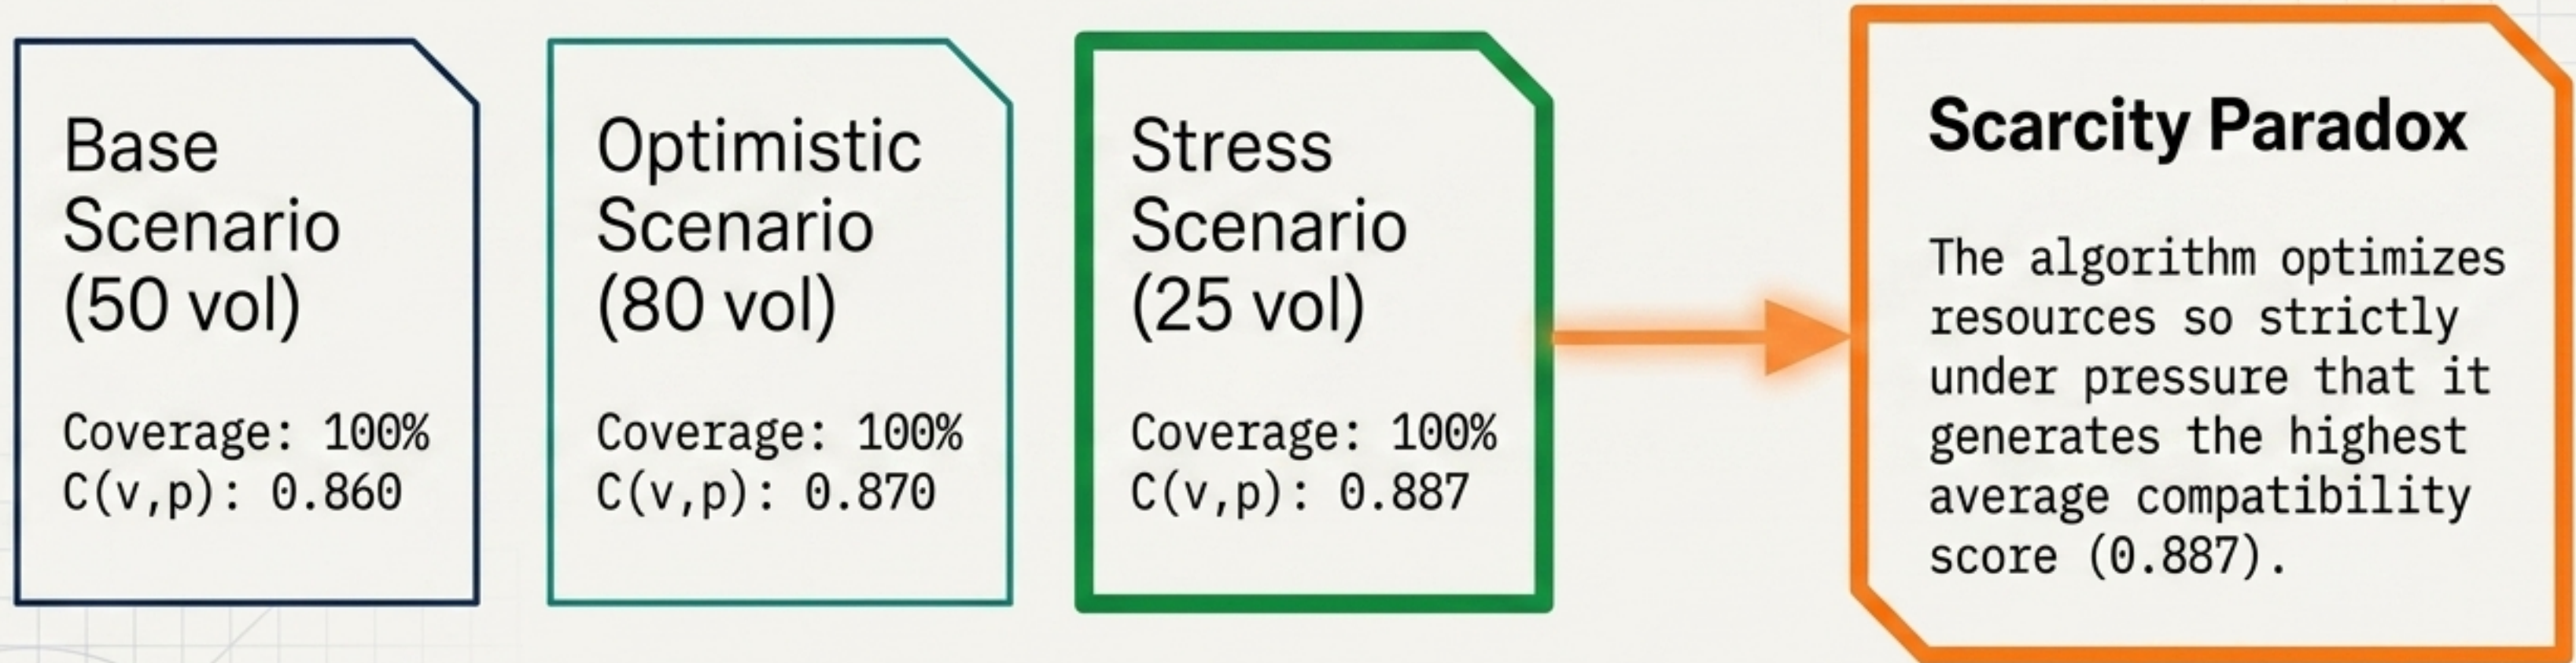

Execution Structure and Critical Path

Methodological traceability from design to deployment.

Simulation 1: Mechanical Validation (Discrete Events)

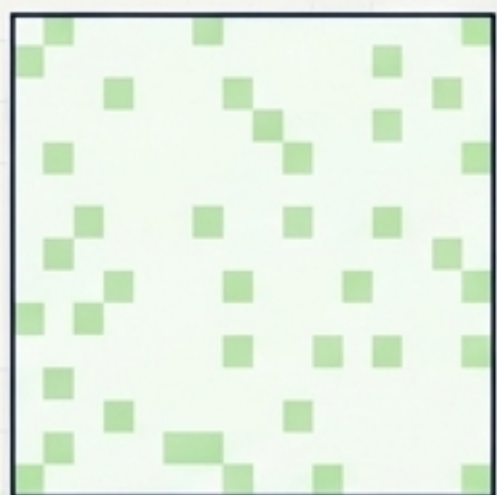

Modeling the assignment pipeline under operational stress (12 weeks).

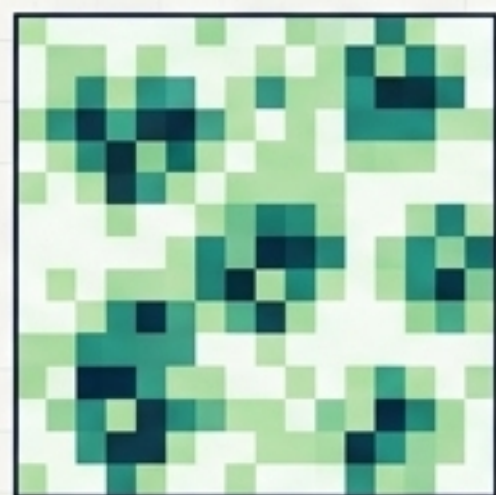

Simulation 2: Organic Validation (Cellular Automata)

The network amplification effect in complex adaptive ecosystems

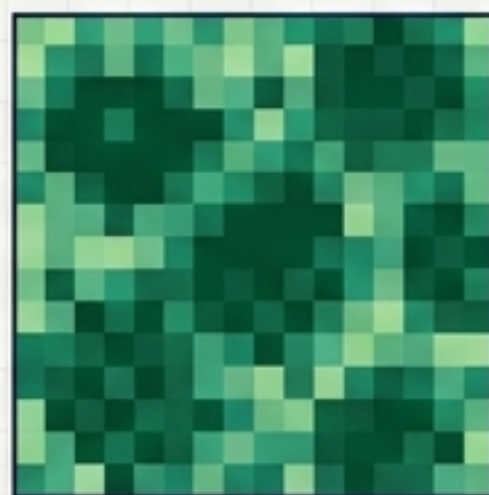

Active Platform (Weeks 0 to 20)

+18%
Amplification

The platform acts as a social catalyst, mathematically accelerating engagement in the university community compared to a manual system.

Emergent Risk: The Burnout Contagion

Computational discovery of chaotic dynamics and the domino effect.

Critical Finding

Burnout spreads through social influence. An overloaded volunteer generates a cascade effect, putting the entire network's retention at risk.

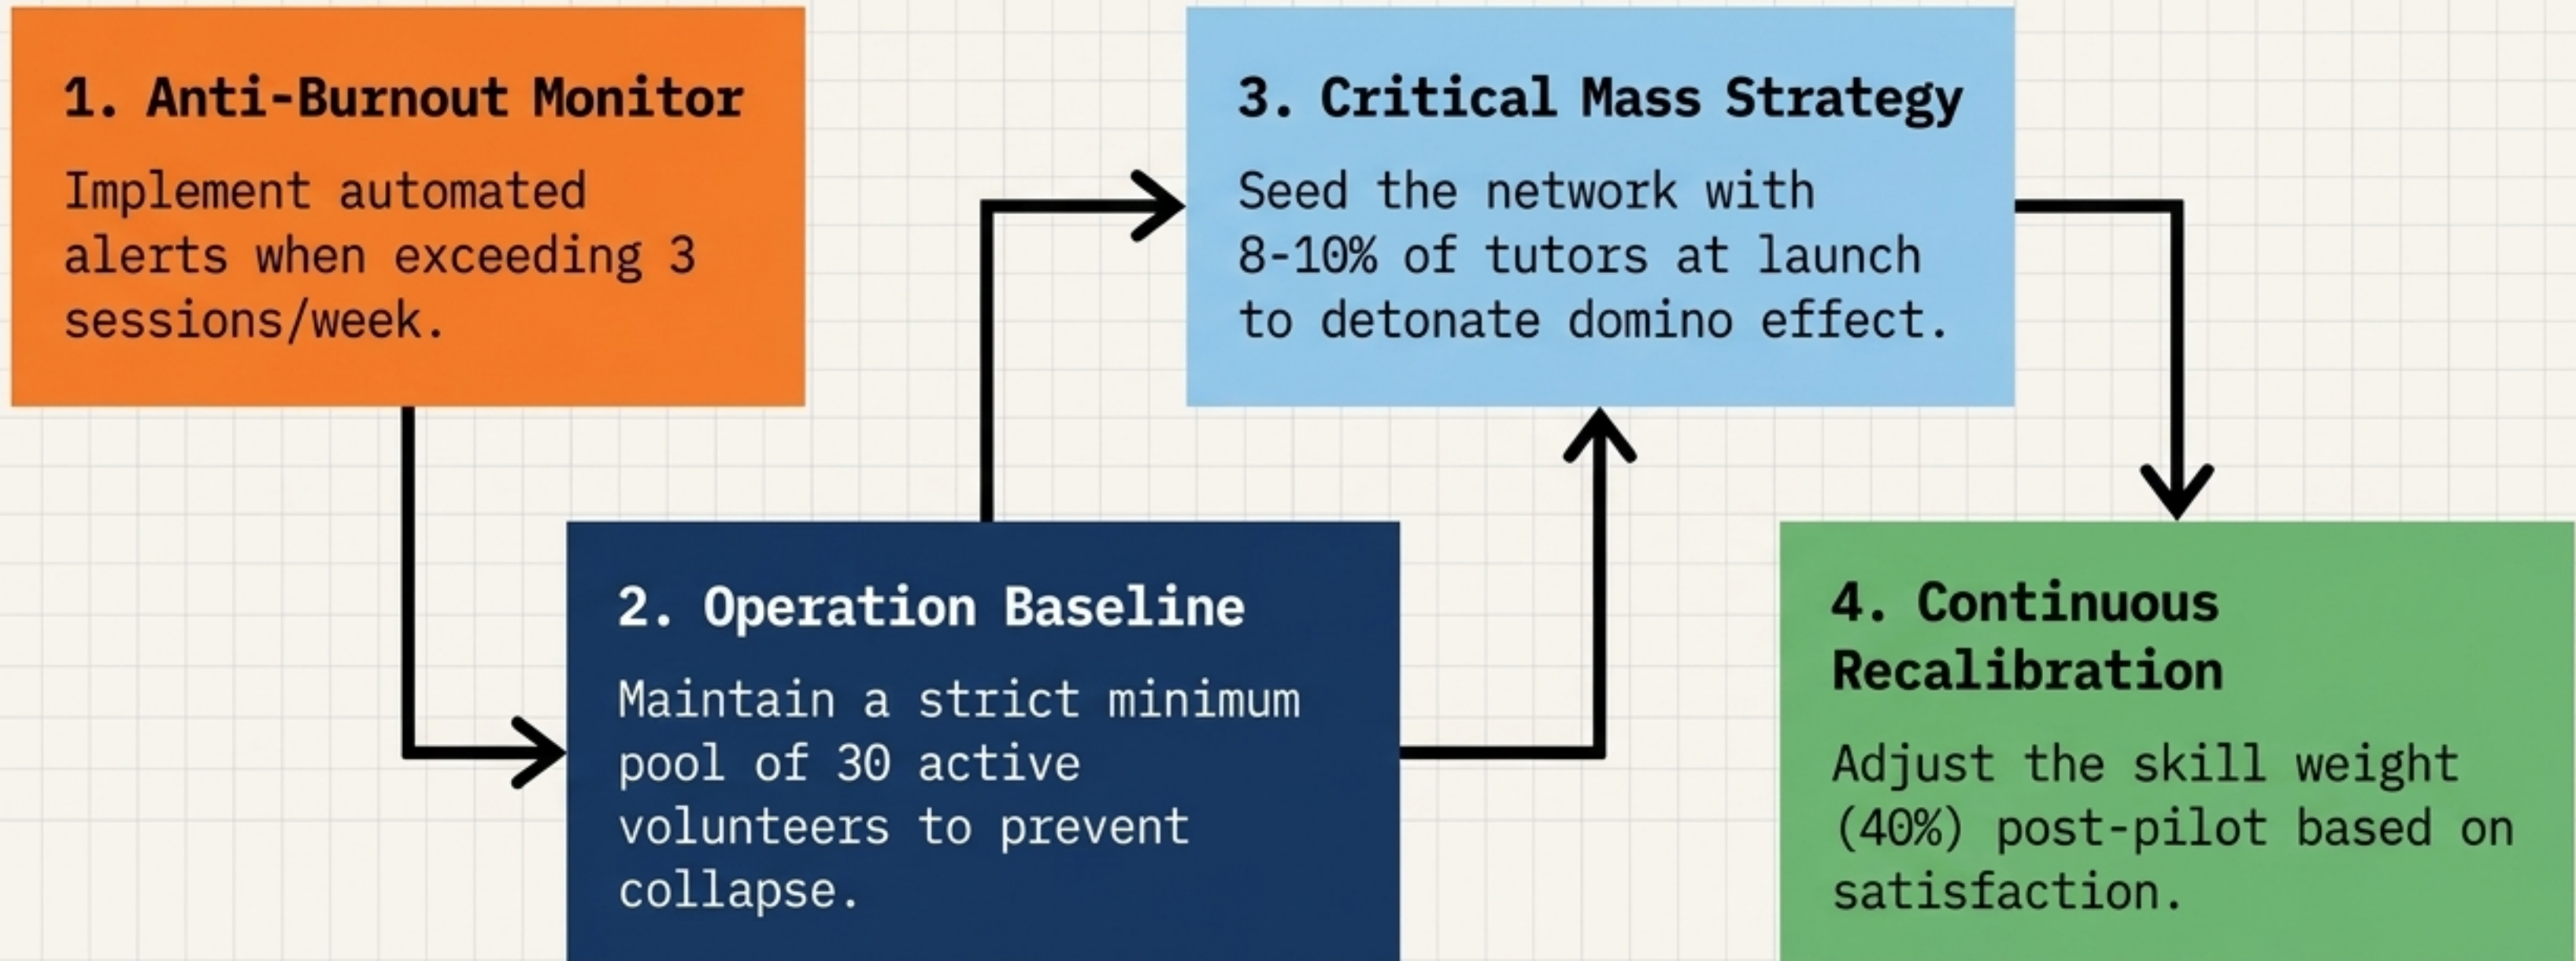

Design Validation vs. Simulated Reality

Empirical verification of architectural requirements.

Design Goal (W2/W3)	Simulation Result (W4)	
Assignment Latency: < 60s	Average 45ms	
Project Coverage: > 70%	100% in all scenarios	
Compatibility Quality: > 0.80	Range 0.860 - 0.887	
Risk Discovery	Identification of Burnout (R005)	

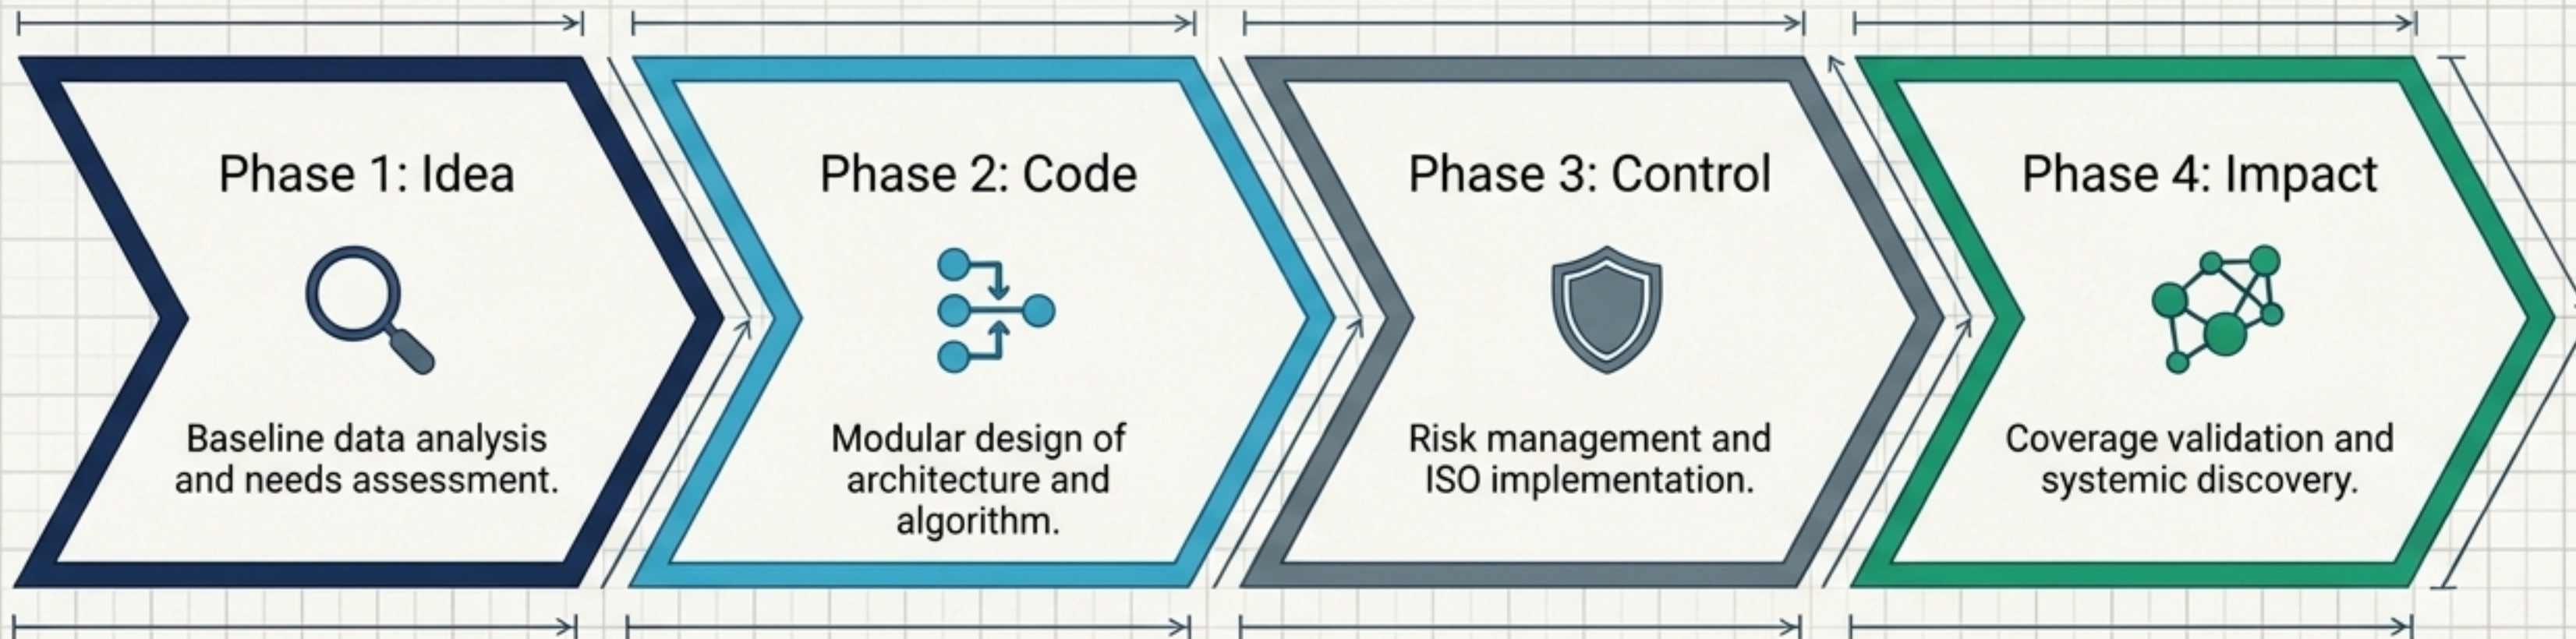

Implementation Roadmap

Recommendations based on complex systems simulations.

“Engineering Lifecycle Conclusions” in System Navy

From a disorganized manual process to a mathematically validated digital ecosystem.

Educational Volunteer Coordination Platform

Systems engineering serving social impact.

Repository of Code, Simulations, and Documentation.
